

METHOD AND APPARATUS IN A WIRELESS COMMUNICATION SYSTEM
FOR DETERMINING A LOCATION OF A MOBILE STATION

Abstract of the Disclosure

5

A plurality of reporting devices (108, 110) and a location server (106) obtain (502) and store location information corresponding to a target MS (108) in a wireless communication system (100). A portion of the system (100) defines (504) a subset of the plurality of reporting devices near the target MS. A location server 10 (106) elicits (506) the location information corresponding to the target MS from the subset, and combines (508) portions of the location information to determine the location of the target MS.
